

Monnify API Feature Cheat Sheet

This developer-friendly cheat sheet maps out the core feature categories of the Monnify API into concise one-liners and practical scenarios to help you rapidly select, prototype, and build your solution for the [APIConf Hackathon](#).

1. Payment Collection

- **One-Time Web/Mobile Checkout:** Initiates a secure, multi-channel payment widget (Cards, USSD, Transfer) for immediate individual sales.
 - *When to use:* Best for standard e-commerce checkouts, one-off event ticket sales, or simple digital product downloads.
 - *Docs:* [Monnify Web SDK Integration](#)
- **Customer Reserved Accounts:** Generates permanent, dedicated bank account numbers assigned directly to a specific user or customer profile.
 - *When to use:* Perfect for fintech wallets, savings apps, or any platform where users need to fund their in-app balances instantly via standard bank transfers.
 - *Docs:* [Reserved Account Architecture](#)
- **Dynamic & Static Invoices:** Generates trackable, customised payment invoices with explicit amounts, line items, and set expiration dates (up to 6 months).
 - *When to use:* Ideal for B2B services, recurring monthly utility billing, marketplace orders, or post-delivery merchant payments.
 - *Docs:* [Invoice Payments Overview](#)
- **Card Tokenization:** Securely saves and registers a user's card data during their first transaction to allow automated headless future debits.
 - *When to use:* Essential for implementing subscription-based SaaS platforms, weekly/monthly gym memberships, or automatic utility refills.
 - *Docs:* [Tokenized Payments \(Recurring\)](#)
- **Direct Debit Mandates:** Digitally sets up and seals an authorised legal mandate to automatically pull variable funds directly from a customer's bank account on a schedule.
 - *When to use:* Ideal for structured loan repayments, monthly mutual fund investments, or postpaid utility invoicing.
 - *Docs:* [Direct Debit Mandates Introduction](#)
- **Offline Pay-ins (Via Moniepoint Agents):** Allows merchants to programmatically set up fixed, variable, or invoice-based "Offline Products" that customers can walk into any Moniepoint POS location to pay for with physical cash.
 - *When to use:* Absolute game-changer for betting wallet top-ups, utility collections, thrift/contribution apps, or fintech platforms targeting unbanked/cash-reliant users.
 - *Docs:* [Offline Pay-ins Developer Guide](#)

2. Payouts & Disbursements (Transfers)

- **Single Transfers:** Triggers real-time programmatic fund disbursements from your Monnify wallet directly into any Nigerian bank account or mobile wallet.

- *When to use:* Essential for instant user withdrawals, real-time peer-to-peer (P2P) transfers, or processing individual vendor payouts.
- *Docs:* [Single Transfer Flow](#)
- **Bulk Transfers:** Enables the execution of up to 5,000 distinct financial payouts bundled cleanly into a single API batch request.
 - *When to use:* The go-to option for automated payroll distributions, affiliate reward payouts, or bulk multi-vendor settlements.
 - *Docs:* [Bulk Transfer Pipeline](#)
- **Paycode API:** Generates secure 10-digit cash redemption codes allowing physical withdrawals at localised Moniepoint agent points.
 - *When to use:* Great for building financial inclusion apps where unbanked or underbanked users need access to physical cash without a debit card.
 - *Docs:* [Monnify Paycode API](#)

3. Advanced Settlement Tools

- **Transaction Splitting/SubAccount:** Automates the internal division of a single incoming customer payment across two or more sub-accounts based on predefined percentages or amounts.
 - *When to use:* A must-have feature for building multi-vendor multi-tenant marketplaces (e.g., taking an automatic marketplace platform fee before paying out the vendor).
 - *Docs:* [Sub-Accounts & Split Payments](#)
- **Refunds API:** Programmatically processes instant full or partial transaction rollbacks back to the customer's payment source.
 - *When to use:* Essential for automating order cancellations, e-commerce returns, or resolving product disputes smoothly.
 - *Docs:* [Refund Transactions API](#)

4. Identity & Verification

- **Verification APIs (KYC Match):** Programmatically validates bank account details (via Name Enquiry), BVN linkages, or NIN records against original state registries.
 - *When to use:* Crucial for onboarding compliance, preventing fraud during user registration, or validating payout account names before initiating a transfer.
 - *Docs:* [Verification & Identity Methods](#)

5. Value Added Services (VAS)

- **Bills Payment API:** Enables your system to query billers and programmatically vend utility subscriptions, airtime top-ups, and internet data packages.
 - *When to use:* Use this to easily build or embed digital lifestyle utility features directly within your core application.
 - *Docs:* [Bill Payment Integration](#)

Pro-Tips for Hackathon Teams:

1. **Webhook Verification:** Ensure your team handles incoming webhooks properly for final transaction statuses rather than heavily looping standard GET status endpoints. It's cleaner, faster, and respects rate limits.
Docs: [Monnify Webhooks](#)
2. **Offline Payer Verification:** Note that Offline Pay-ins require implementing a mandatory Payer Verification Endpoint on your server. When a customer gives their ID to an agent, Monnify hits your backend in real time to verify the user and the invoice before cash is accepted!
3. **MFA Toggle:** Multi-factor authentication (OTP) is active by default in the Sandbox disbursement wallet. If you want seamless, headless programmatic payouts for your demo, reach out to the monnify team to disable OTP on your disbursement.
